// this is the heaker file for the code to convert from whilart to the nameric encoding // that we internally call group. Note: this is different from the Odd group which is // the an Unarter. Our group is an encoding of a new consisting of 10th characters // into a numeric representation of which group of the characters a character in the // neme corresponds to. This is done using the grouparray dat file which contains the // group assignments for each valid IN character. grouparray dat the which contains the and is used as a lookup table.

7. Create a handler for the MH_CDMMID message, and implement as follows:

BOOL Croumbialog::PremvanslandMessage(NGS* phsg)

{

    Override or create a handler for the dialog's Ordancel () werber and
handle the processing something like:
void Ordantialog: Ordancel ()

                                          4. In your Chialog-derived class's Oninitibialog member, subclass the control, and initialists the pages like:
a preer; absclassinglerer(IDC_TAB_CONTROL, this);
a_sheet. Addrage(fa_ThisPage);
a_sheet. Addrage(fa_ThisPage);
a_sheet. Addrage(fa_ThisPage);
a_sheet. Addrage(fa_ThisPage);
a_sheet. Addrage(fa_ThisPage);

3. Also in your Chialog-derived class, create instances of the pages in the header file, like:
Chialogo m_missage;
Chialogo m_missage;
Chialogo m_missage;
Odnichago m_Mischage;

    In your Chialog-derived class, create an instance of this class
in the header file, like:
CractiSheet m_shet;

    Create your dialog resource, placing and sizing the tab control
as desired.

    Overrido or create a handler for the dialog's GnOX() member and
handle the processing something like:
void CYoutDialog::GnOX()

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    // See if the sheet hardles it.

NAS.CPP 3-24-98 1:11p

Cupyright (C) 1998, Language Analysis Systems Inc.

has.h: interface for the mas class.

Summer 1997: Robert Drabek - ported from the original Clipper code.

This file defines the nat (None-Analysis System) class, whose goal is to ubstrikt a name asyment for internal blusts allocad as belonging to one of a limited set of language types the set currently consists of a classic, Chinese, and Hispanic momes. Wene for which the confidence level is low for all of these categories is identified as "unknown."

The classification algorithm is based upon statistical analysis of dingal and circipal forgameries of broom names. But a set of tubbes of well-broom names is examined for names before the counting phase, and the score will be taken from these tables when so found. A name must only apprain in one table. The scores for the other languages will be assigned apprain in one table. The scores for the other languages will be assigned.

## 2. Interface:

The class constitution is to be given the names of the name, digraph and eligipath databases (100 files). The spet\_status() meather function should then be checked immediately for a seto (0) value which would indicate satisfactory infeltiation; now exero values would indicate specific reasons for failure. The function get\_message() will return a string representation of the failure, if desired.

After construction, a name (a properly terminated character array) is appeal to the analyze() series function, which returns one of the "language" enamented types. Analyze() also testing the internal values of the calculated scores for each language group, and these are accessible through the

get\_a\_score(), get\_c\_score() and get\_h\_score() member functions. Damining these values could yield more detailed information for further classification.

Besides having the highest accré, the returned name category must also pass a threshold specific to each name category. These values can be per\_aj\_threshold(), ser\_cg\_threshold(), ser\_ny\_threshold(), ser\_ag\_threshold(), ser\_eg\_threshold(), ser\_ag\_threshold(), ser\_ny\_threshold(), ser\_ny\_threshold(), ser\_ny\_threshold(), ser\_ny\_threshold(), ser\_ny\_threshold(), ser\_ny\_threshold(), and ger\_ny\_threshold(), and ger\_ny\_threshold(), ser\_ny\_threshold(), et and gotten through the

The following times are probably the minimum required in the calling module in order to use this header file:

#include <use\_ansi.h> #include <use\_ansi.h> #include <map>

#pragna warning(disable: 4786) using namespace std;

The DBF files are read using the dbf class defined elsewhere. The relevant contents are then stored into private SIL map (name\_table\_t, digraph\_table\_t and trigraph\_table\_t) data menters. The init() menter

MAS.H 3-24-98 1:11p

# function is where all of this work is accomplished.

The keys for the maps are atther a char pointer (char 1), an unsigned explore quantity (a kED) or an unsigned forta-byte aquantity (a bED) is the charge of the charge of the charge of the best of the charge of th

# 4. Tables (external files)

For each language there are three types of tables, NAWS, DIGANH, and CALCANH, and CALCANH, and CALCANH, and the seat type three is one for given have and one for surmers heres, a total of it tables. The shaking conventions should be clear from these exemple Arabic cables:

ASSMET.REF. ACTOL LEF. ANTIL LEF.

ASSMET.REF. ASSMET.REF. ASTRILLER

The column names in the digraph and trigraph were unfortunately not well tosen when the original dipper program was built, but we are retaining then here for backeria compatibility.

N.B. Currently (Summer 1997) the given-name digraph and trigraph
 capability is disabled since the tables themselves have not yet been
 built.

Witndet NAS H

#if MSC\_VER >= 1000

#endif // \_MSC\_VER >= 1000

Added by ETB so that the code can compile on its own as a library Note that this means that NSS vill (as currently set up), only consider the liter 16 obars of a name when doing classification. Obarges in this value might also require charges in the length of the associated DSF (iller, since their length currently is 16.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              -> - bicVal;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              piox ~
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       To use this function, you must first call the inicomsonantBitvalArray function somewhere in your code. It needs to be called just once.
                                                                                                                                                                                                                                                                                     The value is created by walking through the string, and looking at each character separately. Buth character is support to a particular bit within the 32 bit value.
                                                                                                                          haction to transform a UCV string (a string of IPA consonants) into a 32 bit value.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  More that this method of encoting is limited because we loose information about the number of occurances of each character, since we only get one bit for each character.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           while (constraint for 1- '\0') (constraint for the '\0') (constraint for the '\0')

Adding SPRBOL_SD (SPRBOLS + 5)
The types symbol and supersymbol must both be unsigned, offset must be a signed type, state must be an unsigned type. A variable of type supersymbol must be able to hold any valid value of symbol plus the ablictional values defined following.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       machineType type;
